EnergyStar

Wikipedia

“Energy Star is a United States government program to promote energy efficient consumer products”

EnergyStar Label

Granting use

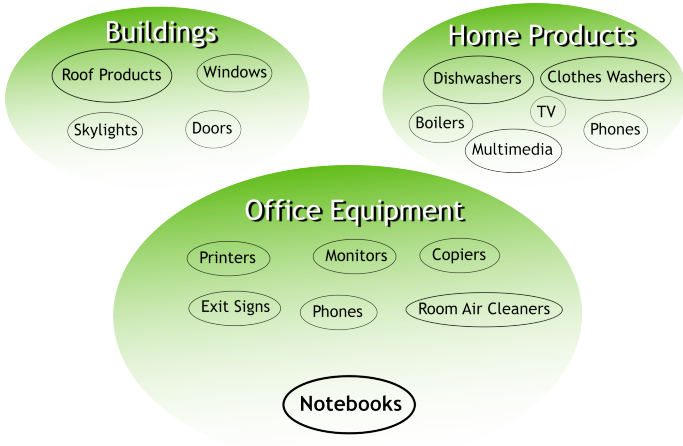

US Government decree to allow the use and procurement by public authorities

European Commission

- Subset of specs
- Own specs
- Only office equipment
- 28-12-2006: Adoption of Computer Spec

ENERGY STAR® Program Requirements for Computers

Table of Contents

Partner Commitments	2
Commitments	2
Performance for Special Distinction	4
Eligibility Criteria	5
Section 1: Definitions	5
Section 2: Qualifying Products	8
Section 3: Energy Efficiency and Power Management Criteria	8
Tier 1 Requirements	8
Tier 2 Requirements	11
Section 4: Test Procedures	12
Section 5: Effective Date	14
Section 6: Future Specification Revisions	15
Appendix A: ENERGY STAR Test Procedure for Determining the Power Use of Computers in Standby, Sleep, Idle and Maximum Power	16

Laptop Categories

Category A

All laptops which do not fit into Category B

Category B

Video card with more than 128 MB *non-shared* memory

Requirements

Laptop needs support for...

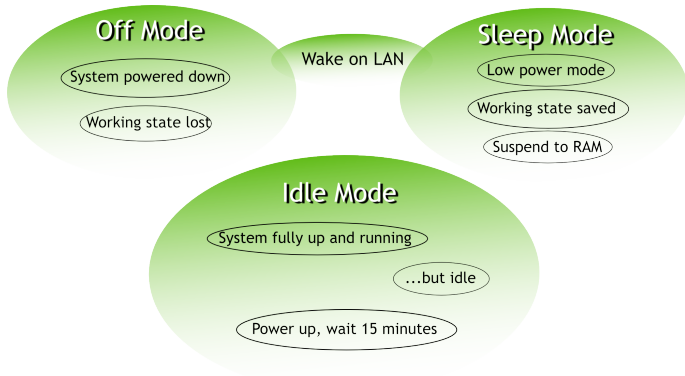

- Working Sleep Mode (Suspend to RAM)
- Wake On LAN

Software Settings

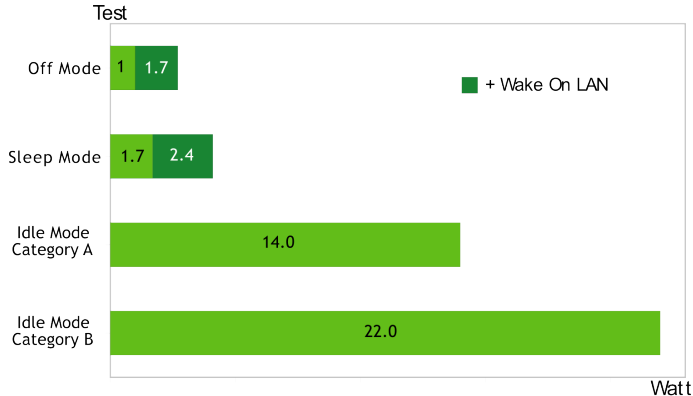

- Display to go into sleep after 15 minutes
- System to go into sleep after 30 Minutes

Operational Modes

Consumption Limits

Test Setup Requirements

- Configured as shipped
- Network connectivity
 - Live network connected
 - Wireless network off (antenna off)
- No external devices such as hard disks, mice, UPS, etc.
- No battery. If not possible, make sure battery is fully loaded
- Power meter connected between main outlet and the AC power supply

Test Procedure

All Tests

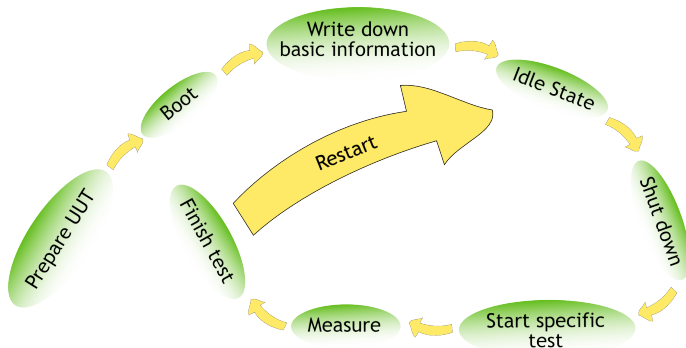

- 1 Record the laptop's system information
- 2 Make sure it is configured as shipped by default
- 3 Configure display to power down after 1 minute
- 4 Shut the laptop down

Specific Idle Test

-
- 5 Switch the laptop on, log in
 - 6 Default desktop
 - 7 Wait 15 minutes until the system is idle, display now off
 - 8 Start measurement for 5 minutes (one reading per second)
 - 9 Calculate arithmetic mean
 - 10 Send results to EnergyStar

Big Picture

Computer/Laptop Specification

Example Test Sheet

(http://opensuse.org/PowerMeasurements)

General

Model: Example system
 Manufacturer: PowerManufacturer
 CPU: Mobile 64 bit, 800 Mhz
 RAM: 480MB
 Operating System: openSUSE 10.3
 AC Voltage: 230 V
 Category: A B

GFX Card

Model: Onboard graphics with shared memory
 Memory: 32 MB shared
 Resolution: 1024x768
 Bits per pixel: 24

Miscellaneous

Not able to determine if WOL was on or off when the system is shut down

System Capabilities and Configuration

Configured as shipped: x
 Wireless network off: x
 Sleep mode: x
 Wake On LAN:
 Auto display sleep (15'): x
 Auto system sleep (30'): x

Results

What	Result (W)	Required (W)	Passed
Off (WOL disabled)	0.5	<= 1.0	x
Off (WOL enabled)	1.9	<= 1.7	<input type="checkbox"/>
Sleep (WOL disabled)	1.0	<= 1.7	x
Sleep (WOL enabled)	2.7	<= 2.4	<input type="checkbox"/>
Idle	17	A: <= 14, B: <= 22	<input type="checkbox"/>

EnergyStar compliant: x

What You Get

Users

- Huh? Battery still not empty?
- Mobility
- Saving money
- Good conscience

Manufacturers

Marketing

Distributions

Marketing

Companies

Reducing power costs

Everybody Wins!

EnergyStar: Jump on the Bandwagon!

- 4 How about openSUSE
 - Is openSUSE ready?

What Manufacturers need to do...

Manufacturers have to provide...

- Energy friendly hardware base
- EnergyStar compliant default BIOS configuration
- Good interface documentation for accessing power management capabilities

What Developers need to do... 1/2

Kernel

- USB power management
- Sound power management
- WLAN power management
- Dynticks/Tickless
- CPU Frequency Scaling

What Developers need to do... 2/2

Desktop

- Provide configuration possibilities
- Good default configuration
- Don't do stupid things like polling

Base System

- Good policy: Don not run cron jobs on battery
- Intelligent daemons making use of inotify, udev, HAL, etc

What Distributions need to do...

Distributions have to...
Ship EnergyStar compliant
default configuration!

Taking Stock of...

Aggregation between...
Software **AND** Hardware

EnergyStar: Jump on the Bandwagon!

 - Contributors
 - Problems and Discrepancies
- 3 Testing your Laptop
 - The Good Scenario
 - The Bad Scenario
 - Resources of Interest
- 4 How about openSUSE
 - Is openSUSE ready?

Annoying requirements

Auto sleep when on AC after *30 minutes*?

Missing test scenarios for common use cases

- No wireless connectivity
- No application tests (office, mail, editors, etc.)
- No external devices

Combination of Software *AND* Hardware

Cooperation of all involved parties is not always easy

Few laptops with
EnergyStar certification!

Acceptance

Not widely established, but...

...vendors start to work on that, and...

...EnergyStar wins more and more recognition

 - Resources of Interest
- 4 How about openSUSE
 - Is openSUSE ready?

Requirements

- Two computers
 - The Unit Under Test (UUT)
 - Recording system
- Ampere meter
- Measurement software QtDMM
- Script to evaluate QtDMM's exported data

```
$ ./arithmetic_mean.sh qtdmm_data
calculating arithmetic mean...done
Result: 25.30 W
```

 - **The Bad Scenario**
 - Resources of Interest
- 4 How about openSUSE
 - Is openSUSE ready?

Requirements

Read from /proc or /sys

- Keep battery inside the laptop...
- ...but disconnected from power source
- Script to monitor battery drain
- Only Idle Mode testing!

```
$ ./monitor_battery_drain.sh -t 5
Using /proc/acpi/battery/BAT0/state to read from...
Reading for 5 seconds...
Average power consumption: 20.04 W
```

- 4 How about openSUSE
 - Is openSUSE ready?

Is openSUSE ready?

openSUSE is not completely ready

No auto sleep after 30 minutes when on AC

openSUSE Build Service

- <http://software.opensuse.org> (hmacht's Home Project)
 - EnergyStar compliant KPowersave
 - EnergyStar compliant GNOME-power-manager

EnergyStar: Jump on the Bandwagon!

Thanks for listening!
